

# There's a hole in my bucket, dear Liza — Examining side channel leaks in web apps.

Benjamin Holland  
[ben-holland.com](http://ben-holland.com)

# Quick Note Before We Get Started...

- With regard to *some* information in this talk:
  - This material is based on research sponsored by DARPA under agreement number FA8750-15-2-0080. The U.S. Government is authorized to reproduce and distribute reprints for Governmental purposes notwithstanding any copyright notation thereon.
  - The views and conclusions contained herein are those of the authors and should not be interpreted as necessarily representing the official policies or endorsements, either expressed or implied, of DARPA or the U.S. Government.

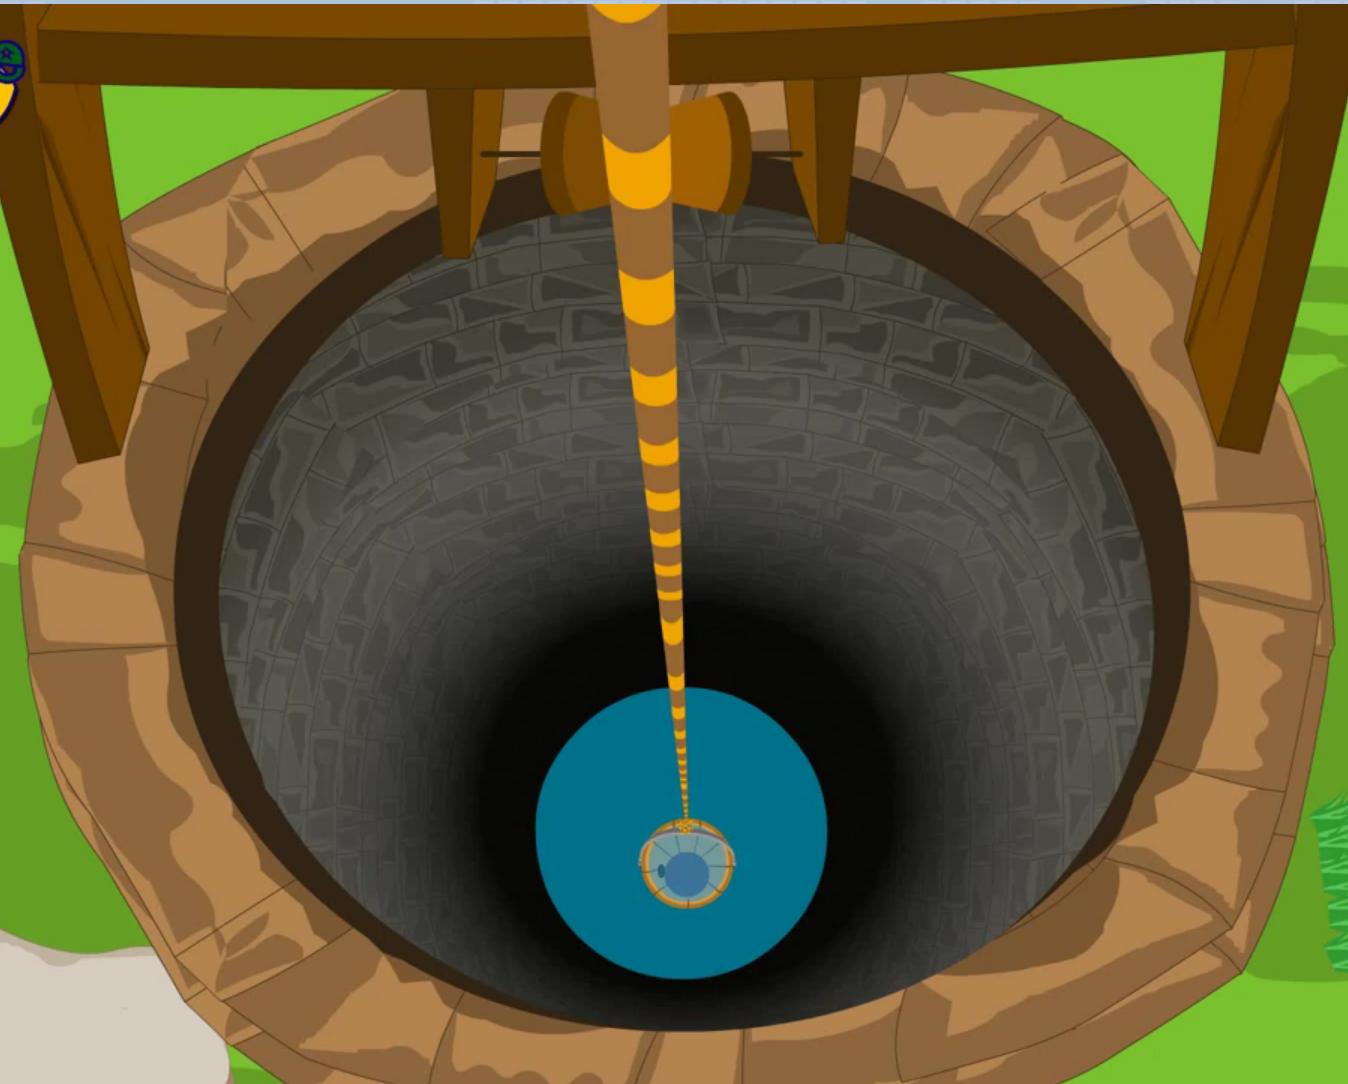

# About Me

- B.S. in Computer Engineering (2005 - 2010)
  - Wabtec Railway Electronics, Ames Lab, Rockwell Collins
- B.S. in Computer Science (2010 - 2011)
- M.S. in Computer Engineering and Information Assurance (2010 - 2012)
  - MITRE
- ISU Research Scientist (2012 - 2015)
  - DARPA Automated Program Analysis for Cybersecurity
  - DARPA Space/Time Analysis for Cybersecurity
- PHD in Computer Engineering (2015-????)

# Talk Overview

- Establish a common understanding of side channel vulnerabilities
- Provide some example side channel vulnerabilities
  - Physical → Hardware → Software
- Causes of side channels
- Discuss challenges in preventing/detecting software side channels

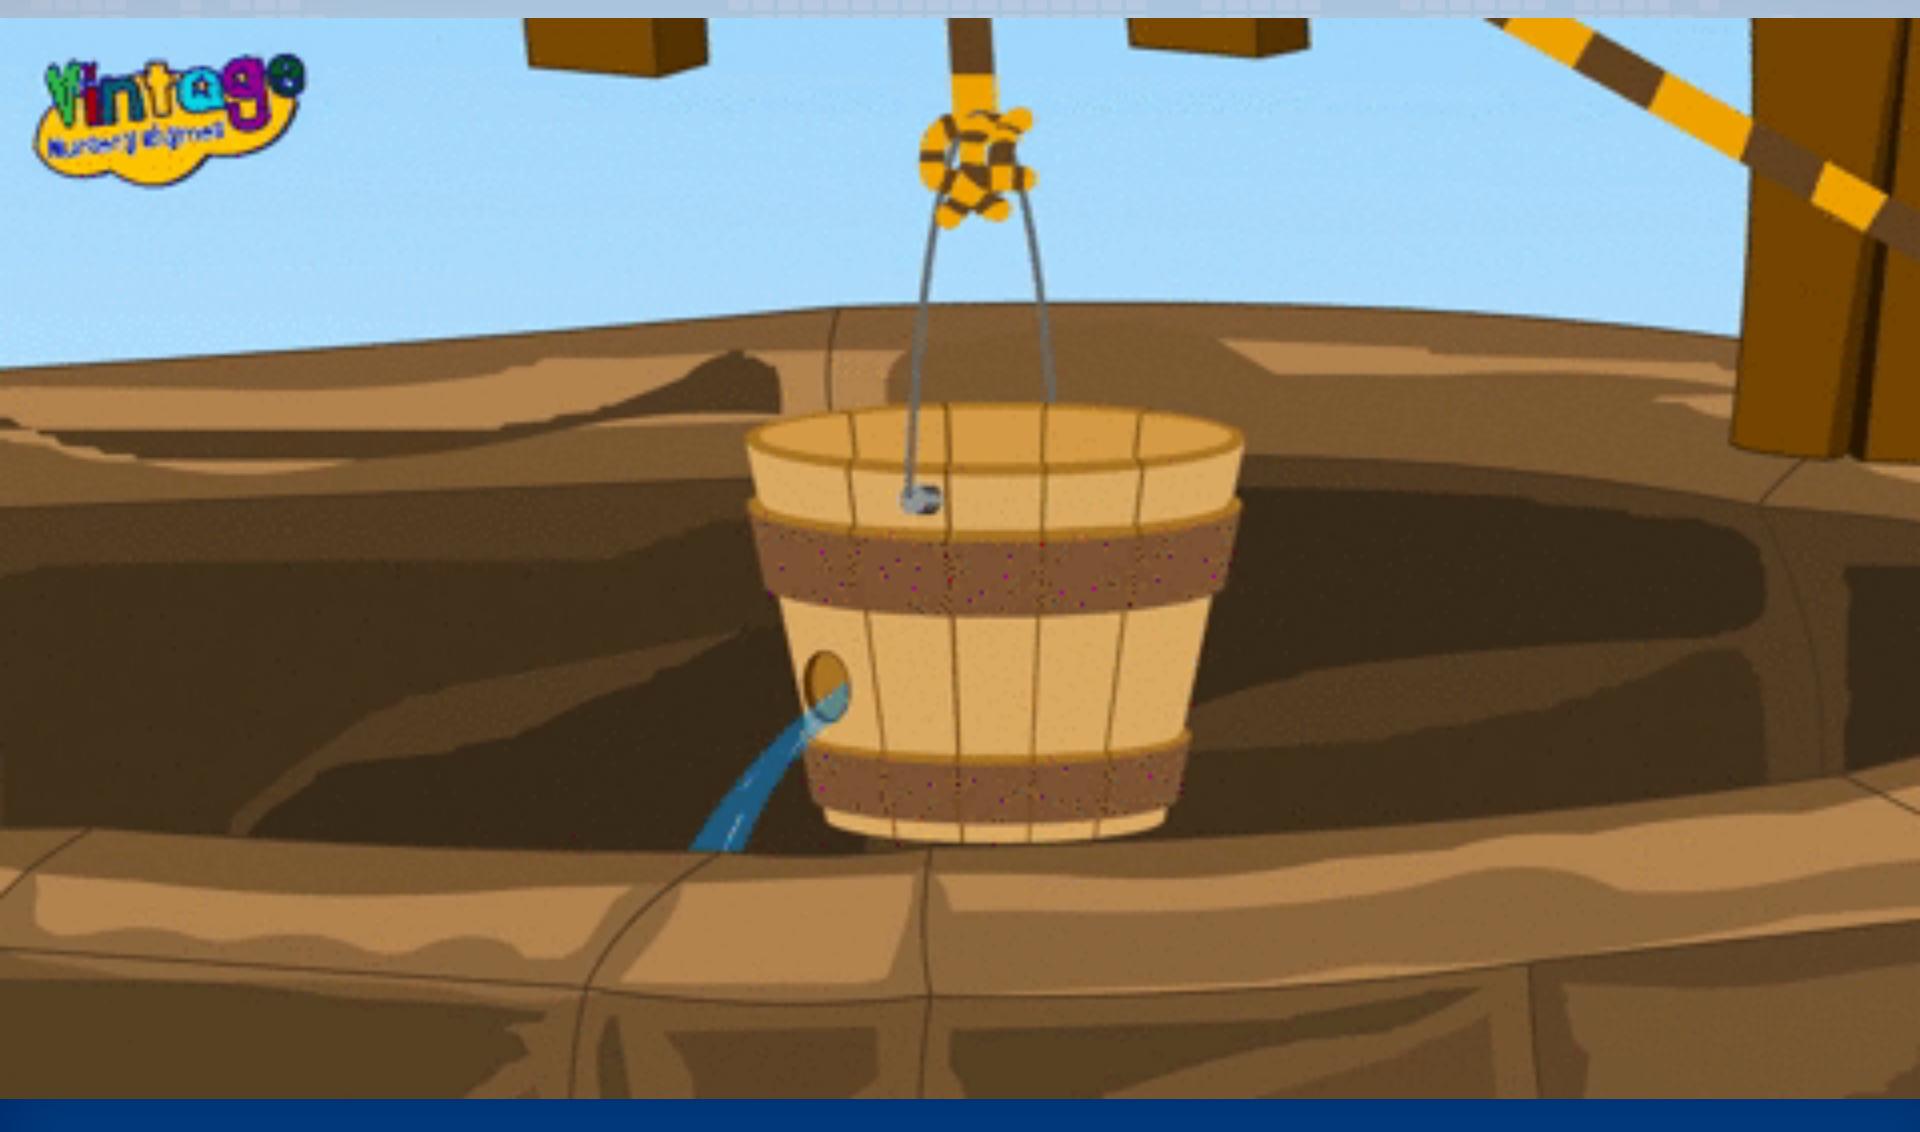

# Setting the Stage

# What's a Side Channel?

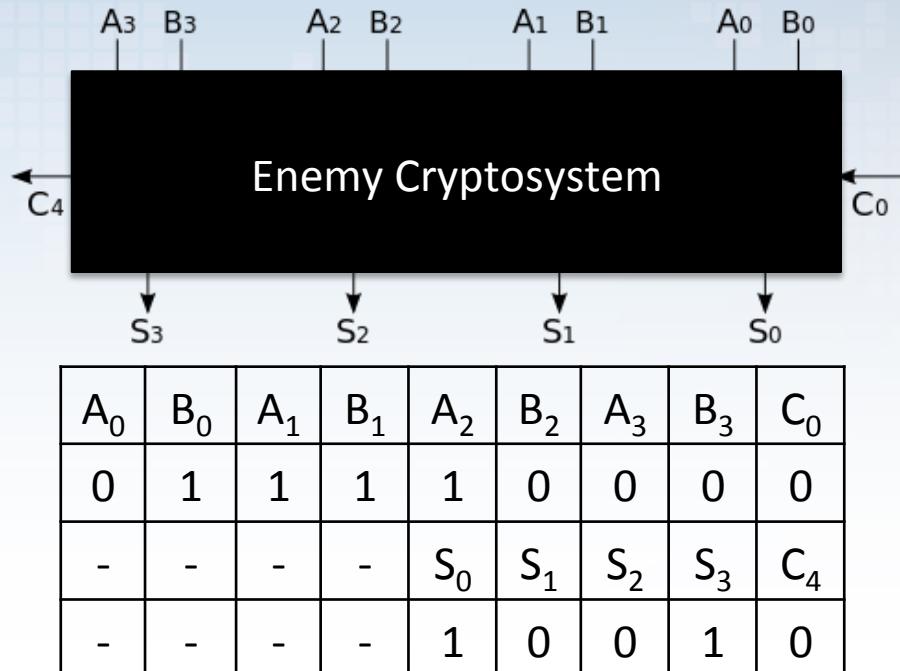

- How big is Henry's bucket?
  - What information do we have?

# Information Leakage (No Pun Intended)

# What's a Side Channel?

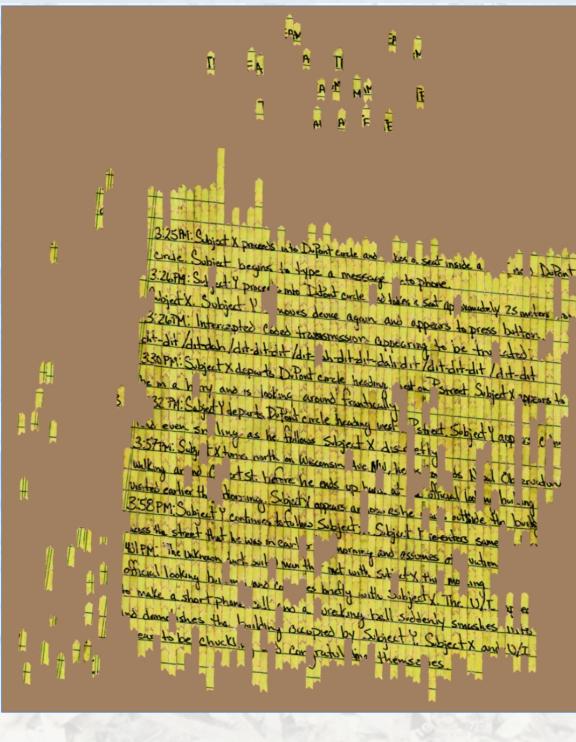

- Historically side channels were used to describe attacks to physical crypto hardware systems
  - Power analysis
  - Timing information
  - Acoustics
  - Faults
  - Electromagnetic radiation
    - Light, heat, IR, etc.
- Some operations require more time, power, etc. to complete than others

# DARPA's Paper Shredder Challenge

- \$50,000 prize to unscramble 5 shredded documents
- Puzzles were completely solved on December 2011 by team “All Your Shreds Are Belong To U.S.”

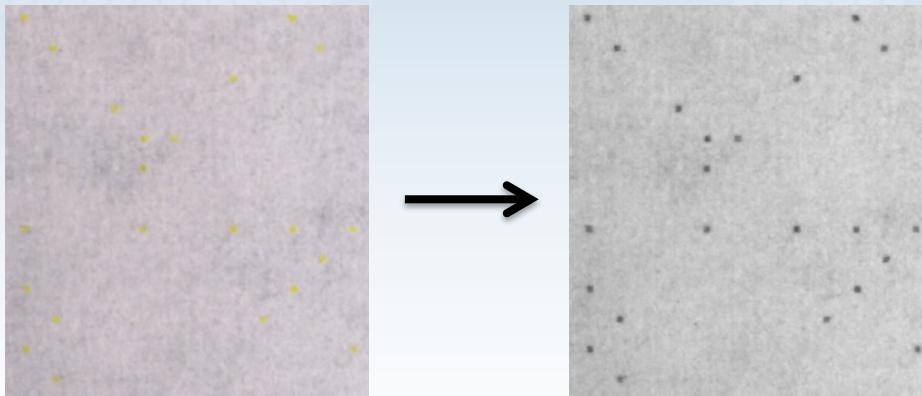

TEAM A	3:25PM: Subject X processes into DPoint circle and takes a seat inside a cafe near DPoint circle. Subject Y begins to type a message into phone.
TEAM B	3:26PM: Subject Y processes into DPoint circle and takes a seat approximately 25 meters from Subject X. Subject Y converses alone again and appears to press button.
TEAM A	3:26PM: Intercepted coded transmission appearing to be truncated. dit-dit/dit-dash/dit-dash/dit-dash/dit-dash/dit-dash/dit-dash/dit-dash/dit-dash
TEAM A	3:30PM: Subject X departs DPoint circle heading west on Pstreet. Subject X appears to be in a hurry and is looking around frantically.
TEAM B	3:32 PM: Subject Y departs DPoint circle heading west on Pstreet. Subject Y appears calm and even smiling as he follows Subject X discreetly.
TEAM A	3:57PM: Subject X turns north on Wisconsin Ave NW, heads towards Naval Observatory, walking around Calvert St. before he ends up back at the official looking building he visited earlier this morning. Subject X appears anxious as he walks outside the building.
TEAM B	3:58PM: Subject Y continues to follow Subject X. Subject Y enters same building across the street that he was in earlier this morning and assumes observation position.
TEAM A	4:01PM: The unknown dark suited man that met with Subject X this morning exits the official looking building and converses briefly with Subject X. The U/I appears to make a short phone call and a wrecking ball suddenly smashes into and demolishes the building occupied by Subject Y. Subject X and U/I appear to be chuckling and congratulating themselves.

**OWASP**  
Open Web Application  
Security Project

# Paper Shredder Side Channel

- A little of life's irony...
  - ~9000 teams competed, 1 team solved all 5 puzzles
  - Solution used hidden printer dots added by printer manufacturers and U.S. Secret Service

- Vision recognition software detected dots printed on paper and used dots as a reference guide to identify document fragments
- Pro-tip: Burn your documents you really want gone...

# Don't Touch Das Blinkenlights

ACHTUNG!

Alles turisten und non-teknischen  
looken peepers! Das computermaschine  
ist nicht für gefingerpoken und  
mittengraben! Ist easy schnappen der  
springenwerk, blowenfusen und  
poppencorken mit spitzensparken.

Ist nicht für gewerken bei  
dummkopfen. Das rubbernecken  
sightseeren keepen das cotton-picken  
hans in das pockets muss; Zo relaxen  
und watschen der blinkenlichten.

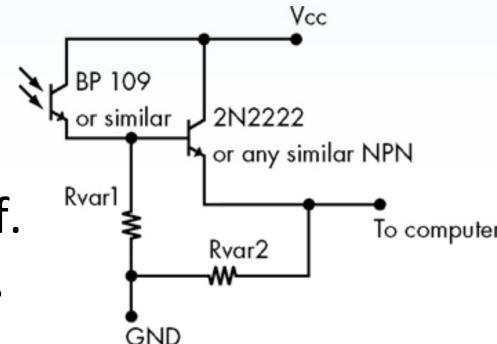

Historically, the blinking lights indicated important things like the state of the system, but as computers became faster and more reliable the lights were either removed or left as diagnostic indicators (example: networking hardware).

# Blinkenlights Problem

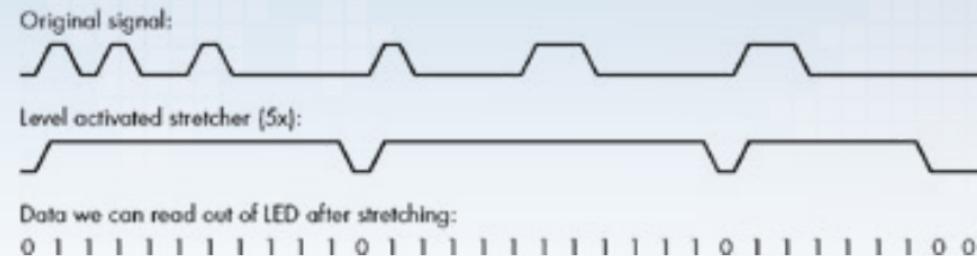

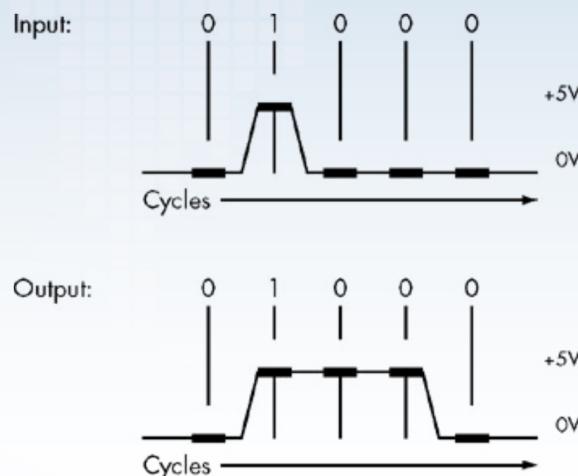

- LEDs on/off time is very fast (almost instant)
  - LEDs are usually used to control fiber optics
- LEDs were wired directly into the serial data line
  - Each blink is a 1 on your network, LED off is a 0
  - Too fast for a human eye
  - Not too fast for a circuit...and a telephoto lens!

Paper: Joe Loughry and David A. Umphress. 2002. *Information leakage from optical emanations*. ACM Trans. Inf. Syst. Secur. 5, 3 (August 2002), 262-289.

# Blinkenlights Solutions

- Duct tape over the LEDs works, but we still want our blinkenlights!
  - Pulse Stretching ☹

Still possible to recover 99.999988% of bits.  
Error correction codes can help us guess the rest.

- Better approach → Low frequency sampling with a latch till the next sample

# Origins of Side Channels

- Short story: optimizations
  - Reducing cost: power, heat, etc.
  - Increasing speed/efficiency
- Consider synchronous vs. asynchronous digital logic circuits
  - Synchronous circuits operate on a fixed clock, all operations take the same time, so the best case and worst case times are the same
    - Every case is the worst case
  - Asynchronous circuits operate without a clock independent of other modules, so there are distinct best, worst, and average cases.
    - Average case costs less than the worst case

# Side Channels in Software

- Leakage primarily through
  - Timing information
  - Memory space usage
    - Content, order, size
- Space/Time usage are related problems
- Optimizations everywhere...
  - Software algorithms
    - Branching, short-circuiting logic, looping, etc.
  - Compiler optimizations
  - Cache hits
  - Process scheduling
  - Branch prediction...and so on...

# Demasking Google Users

1. Select Google users to target
2. Create a Google drive document and invite targets (uncheck option to send notification)
3. Using HTML/JavaScript create a spear-phishing site that identifies and customizes itself for the target
  - 

The image displays two side-by-side screenshots of a web application interface, likely a Java Server Page (JSP) application, running on a local host at port 8080.

**Screenshot 1 (Left): Log In Page**

This screenshot shows the login page titled "Log In". It contains two input fields: one for "Email" containing "admin@example.com" and one for "Password" containing "\*\*\*\*\*". Below these fields is a "Log In" button.

**Screenshot 2 (Right): Secure Area Page**

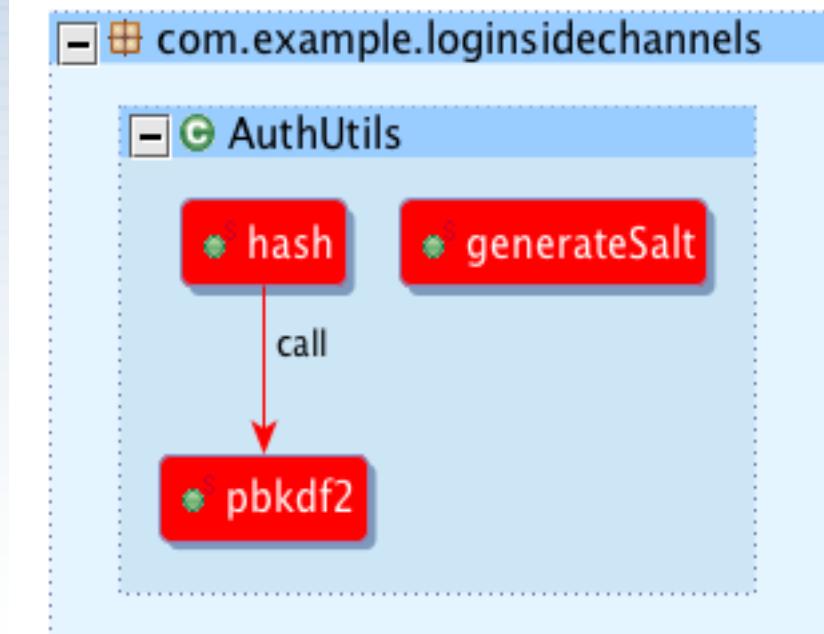

This screenshot shows the "Secure Area" page. At the top, it displays a welcome message: "Welcome admin: admin@example.com". Below this, there is a "Create Account" form. The form includes fields for "Email" (with placeholder "Enter email"), "Password" (with placeholder "Password"), and "Confirm Password" (with placeholder "Password (again)"). There is also a "Role" section with radio buttons for "User" (selected) and "Administrator". A "Create account" button is located at the bottom of the form.

# LoginSideChannels Vulnerability

- The existence of users can be inferred through timing differentials.
- More time is required to validate a password of a valid user than an invalid user.
- Attacker does not need to know any valid passwords and only has to guess at valid users.

# Loop Analysis

- **Approximation:** Loops are expensive and nested loops are more expensive than non-nested loops
- **Loop Call Graph:** Recovers loops, induces call edges, highlights calls of loops called within loops.
- **Note:** Hashes are computed in a feedback loop of N rounds for improved resistance to brute force attacks.

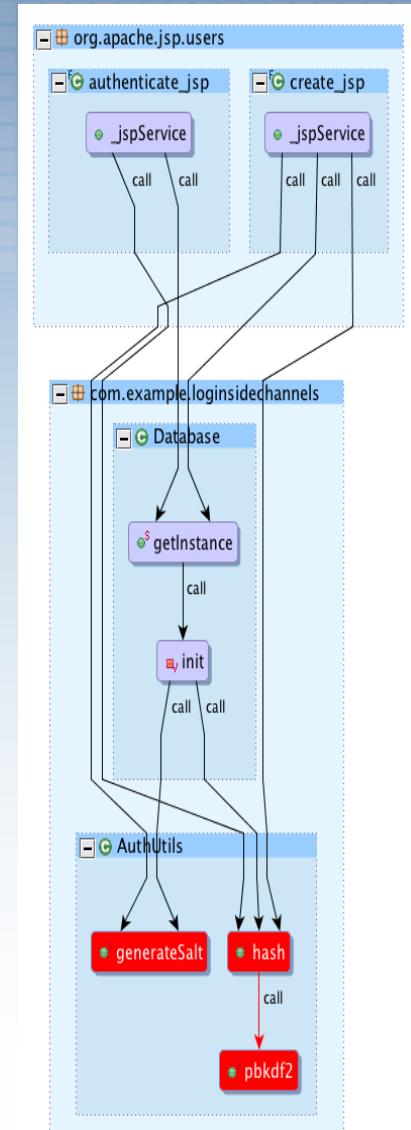

# Loop Context

**Question:** Where are these loops used and why?

**Analysis:** Inspect call graph to get some context

**Answer:** Primarily used by two services: authenticate user and create user.

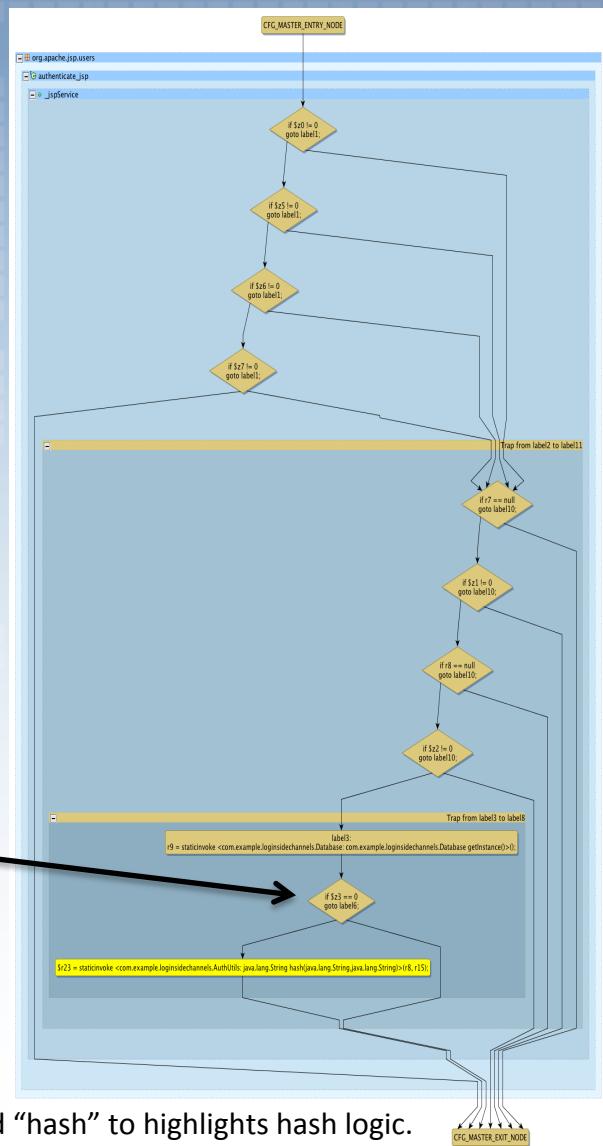

# Find guard conditions

**Question:** Is the expensive logic used conditionally?

**Analysis:** Compute an Event Flow Graph (EFG, a compact graph containing only relevant conditions). Inspect “authenticate\_jsp” method in a EFG.

**Answer:** EFG reveals a conditional guard on the hash. Analyst clicks to view code. Condition depends on result of SQL query.

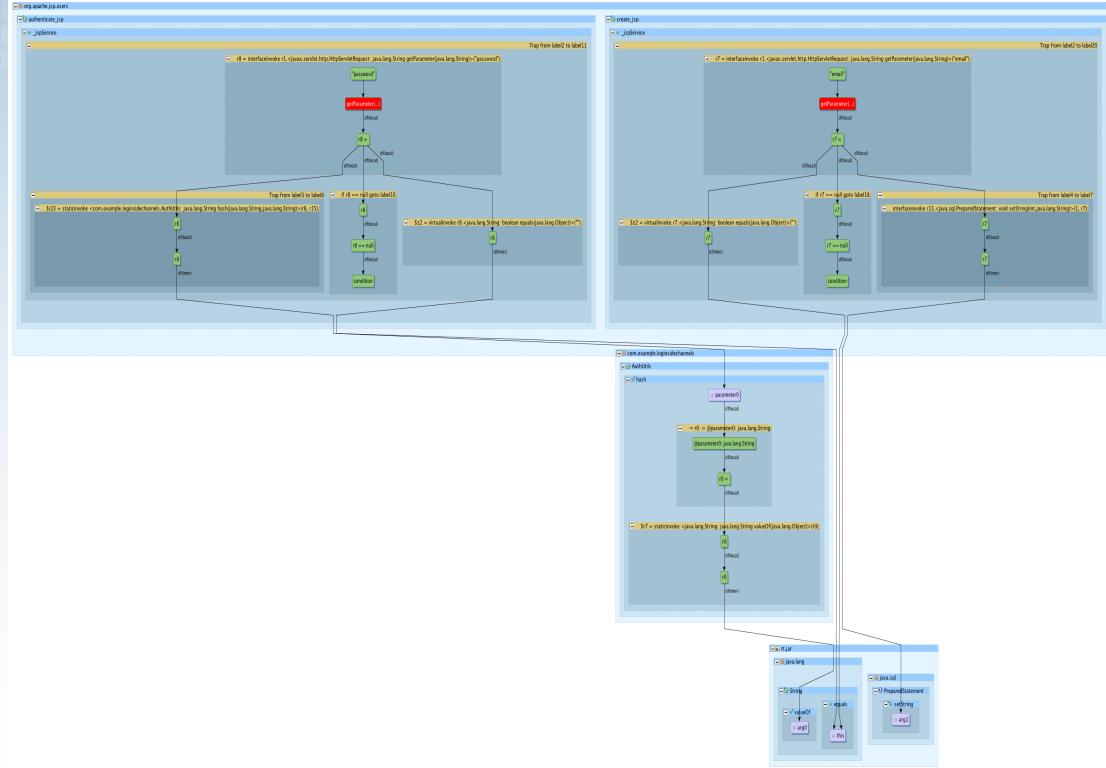

Control-F: Find “hash” to highlights hash logic.

# Check secret confidentiality

**Question:** Can a secret be deduced by this potential timing difference?

**Analysis:** Follow data flow forward from secrets (email, password) to conditionals.

**Observation:** Password flows to hash; email flows into SQL.

# Check secret confidentiality

```
r9 = staticinvoke <Database: Database getInstance()>();  
r10 = virtualinvoke r9.<Database: Connection getConnection()>();  
r11 = interfaceinvoke r10.<Connection: PreparedStatement prepareStatement(String)>(  
    "SELECT * FROM webdb.users where Email=? LIMIT 1");  
interfaceinvoke r11.<PreparedStatement: void setString(int, String)>(1, r7);  
r12 = interfaceinvoke r11.<PreparedStatement: ResultSet executeQuery()>();  
$z3 = interfaceinvoke r12.<ResultSet: boolean next()>();  
if $z3 == 0 goto label06;  
...  
$r23 = staticinvoke <AuthUtils: String hash(String, String)>(r8, r15);
```

**Observation:** The SQL query controls the condition of interest.

**Answer:** Relatively expensive logic (hash) is invoked only if email exists in the database.

# Side Channel Impact

# Side Channel Impact

The screenshot shows the top portion of the Ashley Madison website. It features the brand's logo "ASHLEY MADISON®" in large, bold, serif letters, with a registered trademark symbol. Below the logo is the tagline "Life is short. Have an affair.®". A call-to-action button labeled "See Your Matches »" is visible. On the left, there is a dropdown menu placeholder "Please Select" and a text overlay stating "Over 38,855,000 anonymous members!". The background of this section is black.

**As seen on:** Hannity, Howard Stern, TIME, BusinessWeek, Sports Illustrated, Maxim, USA Today

Ashley Madison is the world's leading married dating service for **discreet** encounters

Trusted Security Award

SSL  
Secure Site

# Future Prediction

Currently side channel exploits are like this...

You are  
vulnerable,  
you just don't  
know it yet.

# Future Prediction

In the future side channel exploits will be like this...

# Some things to check...

- Timing/response of REST operations
- Ordering/content of
  - HTTP Headers, HTTP Parameters, Cookies
- Error messages
- ...
- **Advice:** Start by considering your secrets and an attacker's operational budget

# In Closing

- If there is a hole in your bucket, dear Henry...

# Then mend it, dear Henry.

THEN MEND IT, DEAR HENRY, DEAR HENRY, DEAR HENRY
